Optimizely

REGULATED CONTENT READINESS

Catch regulated-content issues before they become review-cycle problems

PROBLEM

Regulated-content issues are often discovered after briefs, copy and page work are already underway.

That creates avoidable rework, slows formal review and adds burden on MLR teams.

SOLUTION

Move the readiness check upstream into the places marketers already work.

A campaign brief in ClickUp, a request in Optimizely AI Chat or a draft in WordPress can enter the same governed readiness process.

INTENDED RESULT

Issues surface earlier.

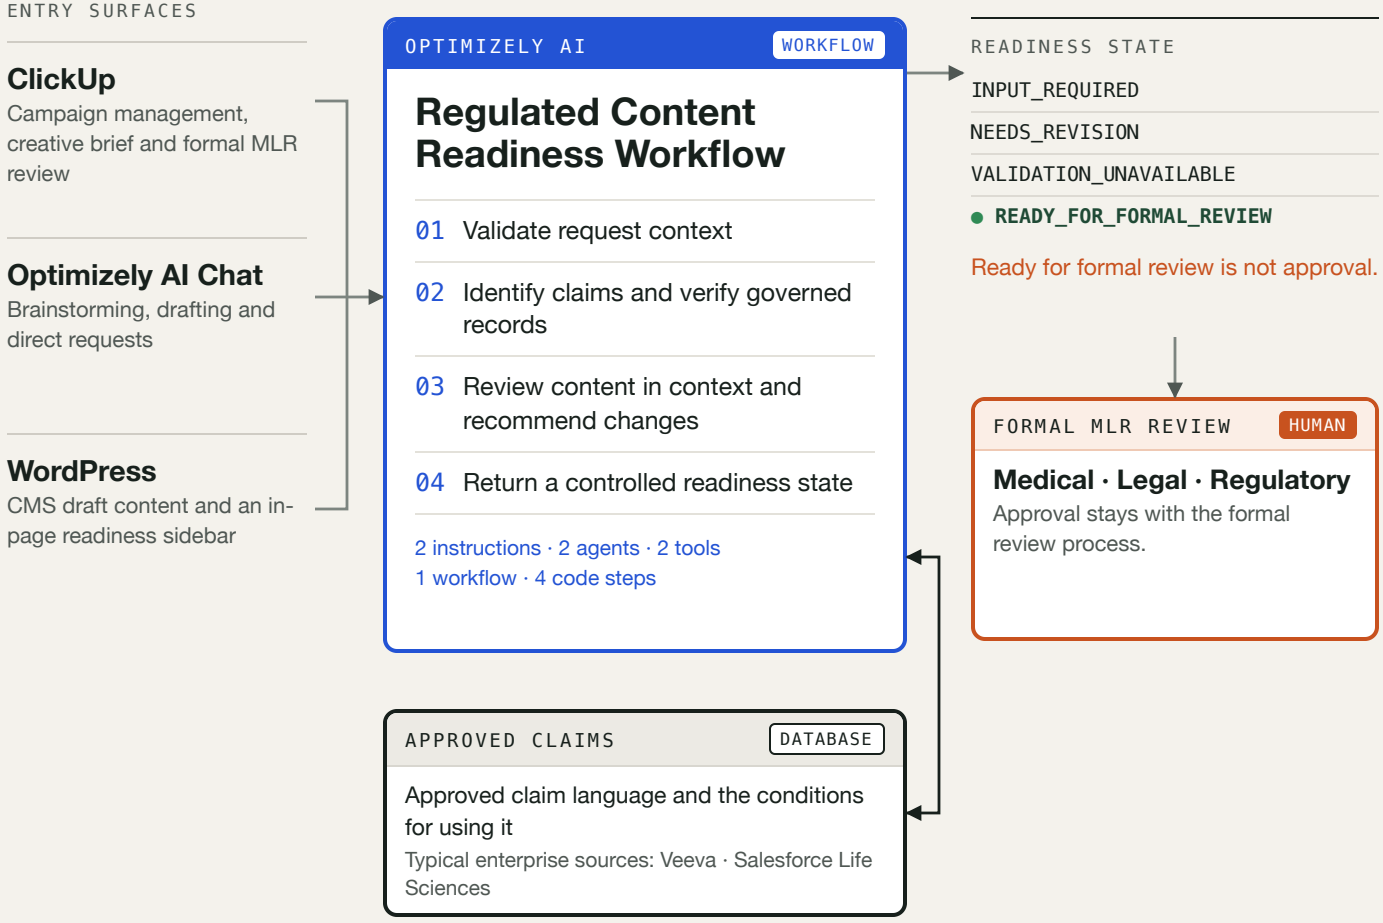

Marketers know what needs attention before formal review, while Medical, Legal and Regulatory teams keep approval authority.

github.com/alexdesigns/fde-opti

Reduce late-stage rework. Shorten the path to formal review.

PHARMACEUTICAL COMPANY: OptiThera

One governed readiness process across the places marketers already work.

From reactive to proactive

The readiness check happens while marketing work is being created, before preventable issues move downstream.

TARGET SUCCESS MEASURES intended, not yet measured

Fewer late-stage revisions · Shorter time to formal review · Higher first-pass readiness

NEXT Deterministic disclaimer validation · Report “validator not called” as its own status · Built-in evaluations on the final versions · Governed MLR integration

Optimizely

SOLUTION ARCHITECTURE

The hard part was deciding where AI actually belongs.

MAIN INSTRUCTION (IN0)

IN0 - OptiThera Content Intake structures the request and starts the governed workflow.

- Gathers draft, market and audience
- Starts on `/content-readiness`, not on a bare "yes"
- Never returns its own verdict

WHAT WAS HARD

Execution tracing showed a correct-looking answer can take the wrong path: Chat once returned a readiness verdict without invoking the workflow. I tightened the intake instruction so the workflow must run first.

An agent also normalized an invalid market value from USA to US. I changed the instruction so caller inputs are preserved.

WHAT I LEARNED

The hard part wasn't getting AI to generate an answer. It was deciding where AI should be allowed to make a judgment and where deterministic rules or people should retain authority.

Reviewer judgment can vary on a borderline draft. Routing and the state rules did not, because code owns them.

How the governed workflow actually works

AI interprets. Tools verify governed facts. Code controls state and routing. People approve.

PHARMACEUTICAL COMPANY: OptiThera

BUILT IN OPTIMIZELY AI

- 2 instructions
- 2 specialized agents
- 2 custom tools
- 1 workflow
- 4 code steps
- 2 deterministic gates
- 2 triggers

VERIFIED CLAIMS — DATABASE

Approved claims / MLR repository

ADVANCE TO FORMAL REVIEW

ClickUp → Formal Review · reviewer assignment stays human

FORMAL MLR REVIEW — HUMAN

Medical · Legal · Regulatory

Human approval required

Happens outside this workflow.

RECOMMENDATIONS

NEEDS_REVISION findings can carry **approved wording** or a **required disclaimer** (exact governed text), or a **suggested rewrite** (not approved copy). A person decides.

submit_readiness_result — TOOL

OptiThera Readiness Callback

Returns the packaged result to Lab and WordPress requests. RC5 writes ClickUp directly.

Known limits. Reviewer wording varies; no platform caller signal.

Stop early. Missing inputs end the run before any agent.

AI where it helps. Agents read claims and context.

Facts and control. Tools fetch facts; code sets state.
